

Biological products

Among biological products, a distinction is made between **cell products used for therapeutic purposes, innovative therapy medicines** (gene therapy and cell therapy), **labile blood products**, as well as **tissues or organs of human or animal origin**. Depending on their characteristics, intended use, mode of production or their nature and origin, they are **not all subject to the same rules**. As such, ANSM is involved at different levels and in a coordination capacity with several health authorities.
